GETTY

Let's be honest: AI is on everyone's agenda. Boardrooms are buzzing, headlines are hyped and nearly every strategy deck has an AI slide. But when you peel back the excitement, many organizations are quietly grappling with a hard truth: AI isn't delivering at scale.

You've likely seen it in your teams—proof-of-concepts or experiments that overpromise and underdeliver, disconnected pilots or systems that wow in demos but struggle in the wild. Sound familiar?

Here's the thing: AI isn't broken. But how we're approaching it often is. Everyone is struggling with AI value.

I've spent more than a decade helping Fortune 100 companies and high-growth enterprises navigate digital transformation, scale AI and analytics products, and deliver measurable outcomes across sectors like retail, healthcare and financial services. From advising C-suite leaders to embedding digital and AI into core business processes, I've seen what it takes to move from AI ambition to execution.

If you're a CXO navigating this space, now is the time to shift the mindset from experimenting with AI to scaling AI with purpose. Not through flashy experiments, but through grounded strategy. Here's a human-centered playbook that has worked across industries—rooted in business value, trust and real-world outcomes.

1. Don't start with the tech. Start with the 'why.'

The temptation is real: jump into generative models, automate everything and showcase quick wins. But successful AI journeys begin differently. They start by asking: What problems are we solving? Why now?

AI is a means, not the mission. Organizations that lead with clear business goals—for example, reducing churn, optimizing inventory or improving customer experience—see more tangible outcomes. With my teams, I've helped retail clients tie predictive modeling directly to inventory optimization, resulting in millions in cost savings and reduced stockouts.

Before launching your next AI initiative, pause. Bring your business leaders together and align on the problem and its urgency. Everything else follows from that.

2. Your people are not bystanders. They're the strategy.

AI doesn't scale without people. And not just your data scientists. Think about people, like operations managers, sales leaders, HR partners, people who make your business run every day.

In my experience, the best transformations occurred when leaders involved their teams early with an AI training and coaching program on all levels. For example, consider launching an AI literacy program like the one [recently started by Ikea](#) to 3,000 of its workers and 500 of its leaders.

The result is often increased adoption, faster feedback loops and real cultural change with a focus on business value. It starts at the top. When executives lead with curiosity, empower their teams and reward experimentation, AI becomes a catalyst, not a threat.

3. Trust is the real differentiator.

AI's ability to learn and adapt is its superpower—and its risk. Model drift, bias or unethical data use can cause more than technical issues. They can damage brand trust, trigger regulatory scrutiny or even harm customers. Consider how McDonald's had to [end an experiment](#) with AI drive-thru ordering due to blunders that led to customer frustration and viral videos on social media.

It is critical to establish robust governance frameworks. Make explainability a standard. Involve legal, compliance and data stewards early. Because trust isn't just ethical—it's strategic.

4. Your infrastructure needs to keep up.

Trying to scale AI on legacy infrastructure is like flying a jet with bicycle parts. As 2024 research by RAND Corporation notes, some estimates see [80% of AI projects fail](#), citing the lack of adequate infrastructure as a primary blocker.

One of our clients had multiple siloed systems, slowing down model training and deployment. After consolidating onto a modern cloud platform, they cut model deployment time by 50%.

If your teams still rely on fragmented data systems or manual processes, scaling AI is a dream, not a plan. Make sure your foundation is ready. Migrate. Modernize. And build for scale, not for a sandbox.

5. AI should feel natural, not forced.

Some of the best AI use cases I've seen didn't come from R&D labs. They came from front-line teams: a claims adjuster using NLP to summarize reports, a recruiter using GenAI for personalized outreach or a warehouse manager optimizing logistics through predictive analytics.

What these have in common is this: AI didn't replace people; it empowered them.

Your job as a leader is to make AI feel like a natural extension of the employee experience. Easy to use. Easy to trust. Easy to adapt.

And remember: The best adoption doesn't come from training decks. It comes from showing people how AI makes their job better—right now.

6. Measure what matters. (Spoiler: It's not model count.)

Many teams obsess over model counts or API deployments. But those are vanity metrics. What matters is business value:

Did AI reduce downtime?

Did we improve onboarding speed?

Are customers more satisfied??

Organizations need to shift focus from proof of concept (PoC) to **proof of value** (PoV). Set clear goals. Track real impact. And celebrate results that move the business forward.

The bottom line: AI isn't a department. It's a way of working.

If you remember one thing from this article, let it be this: AI strategy is a business strategy.

It's not about data science. It's about outcomes. It's not just about tools. It's about trust. And it's not a tech project. It's a leadership agenda.

Yes, the journey is complex. But with clarity, alignment and a human-first mindset, it's absolutely possible.

I've seen it firsthand—from Fortune 100 boardrooms to startup war rooms. The most successful leaders aren't the ones who talk the most about AI. They're the ones who listen the most to their people, align AI to their mission and scale with courage.

So, as you reflect on your own AI journey, ask yourself:

- Are we clear on the *why*?
- Are we building with people at the center?
- Are we designing for value and trust?

Because that's how you move from ambition to real, scaled impact.

Opening The AI Black Box: Why Financial Leaders Need Transparent, Trustworthy AI

By [Nosa Omoigui](#), Forbes Councils Member.

GETTY

As artificial intelligence (AI) accelerates across the financial sector, a critical question remains: Can executives trust the answers AI provides? While Gartner reports that **58%** of financial professionals already use AI tools—with growing adoption for forecasting and

analytics—many remain wary. That's because some of the most popular systems, like ChatGPT and Gemini, offer confident responses despite a [high error rate](#). In a world driven by evidence and risk management, this black-box approach is not acceptable.

Financial professionals require AI that is designed to be transparent and defensible, and to enable more accurate reasoning. The answer lies in a new class of AI systems that combines the adaptive learning of neural networks with the clarity and structure of symbolic reasoning.

The Limitations Of Traditional Generative AI In Finance

Large language models (LLMs) excel at pattern recognition and next-word prediction, but this capability becomes a weakness in high-stakes financial analysis and forecasting.

LLMs are inherently vulnerable to misinformation when data is flawed or misinterpreted, with recent research showing [high and rising hallucination rates](#). Compounding this, their reasoning often lacks transparency, citations and clear logic.

For financial leaders, these limitations are significant. When an LLM provides a confident yet unsupported answer without source attribution or clear reasoning, it undermines trust and introduces considerable risk.

Defining AI Requirements For Financial Analysis

Financial institutions operate in high-stakes, highly regulated environments. Whether assessing AML risk exposure, identifying compliance gaps or uncovering investment alpha opportunities, every decision must be water-tight.

To be truly useful in financial decision-making, AI must deliver more than insights; it must offer traceability, auditability and control. That means every output must be linked to structured knowledge and clear rules, allowing executives to understand not just what the recommendation is, but why it was made.

To earn trust, an AI platform for financial crime and AML compliance must not only flag control gaps but also benchmark them against peer disclosures and regulatory standards, tracing each gap to specific filing sections and rules for instant executive verification. This level of transparency streamlines fact-checking and enables confident, defensible decisions.

For alpha discovery, the platform must benchmark portfolio growth and performance against market leaders, highlighting gaps with direct links to source data. This empowers

investment teams to act on reliable insights and refine their theses with greater conviction.

These systems are built on verifiable evidence, provide automatic audit trails and adapt to changing internal policies, regulations and market conditions.

Essentially, AI must be human-led for financial executives to trust it. An AI tool should empower its user with new, "weaved" insights—integrating data from diverse sources—while also providing the "breadcrumb trail" that engenders trust and defensibility.

How Neuro-Symbolic AI Opens The Box

New AI tools, such as neuro-symbolic AI, address key limitations of LLMs in high-stakes analysis and decision-making. This hybrid approach combines neural networks, which learn from data and detect complex patterns, with symbolic reasoning, which applies explicit rules and logic for transparent, explainable decisions.

A neuro-symbolic AI system can map a bank's AML controls to precise Financial Action Task Force (FATF) requirements, benchmark them against peers and pinpoint gaps, issuing targeted alerts when regulatory risks are rising and linking every recommendation directly to the relevant regulatory clause. This is achieved by connecting dots across filings, regulatory texts and enforcement actions to deliver actionable, fully explainable guidance.

Similarly, the system can assess a portfolio's innovation leadership by benchmarking R&D and patent activity against top peers, detecting hidden risks or opportunities. Critically, it understands context and materiality, so it's not misled by superficial "innovation-

washing." Alerts are grounded in concrete data points, providing clear, actionable recommendations for alpha generation.

LLMs alone cannot deliver this level of structured, multisource, auditable support. In high-stakes workflows, even minor inaccuracies or hallucinations can quickly compound, creating significant risk and eroding trust.

With a hybrid approach, neuro-symbolic AI combines deep learning from large datasets with transparent, rule-based reasoning. For financial services, this enables AI to deliver rigorous analysis with clear, auditable justifications for every output.

Equipping Financial Executives For Confident Decision-Making

Neuro-symbolic AI empowers financial executives with advanced decision support, enhancing oversight and regulatory alignment. By analyzing vast datasets and benchmarking performance and compliance against peers, these systems help institutions demonstrate best practice parity and reduce regulatory risk. By integrating global frameworks such as FATF, FinCEN and Basel III, neuro-symbolic AI can identify specific compliance gaps and recommend next-best actions tailored to each institution's operational reality.

Neuro-symbolic AI delivers analyses that compliance teams and regulators can easily validate. Unlike traditional AI, it produces decision-ready outputs that support a shift from reactive, fragmented oversight to proactive, unified governance.

These platforms empower compliance, risk, finance and investment leaders to benchmark external risk posture and identify opportunities, without internal IT delays. Chief investment officers can target specific theses or portfolios, gaining actionable insights by comparing performance to peers and market signals. This “smoke detector” approach provides rapid wins and builds internal momentum.

Adoption can begin with high-priority risk vectors such as FinCrime, cyber or market risk, and scale to others like credit, operational, conduct, model, strategic and third-party risk. Firms can expand incrementally, targeting specific regulations, risk domains or investment strategies as value is demonstrated.

This phased strategy helps overcome legacy barriers, accelerate results and justify broader investment. For example, one global bank I worked with rapidly closed cyber and AML gaps through external benchmarking, while an asset manager’s CIO identified and addressed underperformance in key portfolios. Both achieved rapid impact, scaling adoption to strengthen risk and investment outcomes across the enterprise.

From Black Box To Command Center

The message to financial leaders is clear: Trust will determine the trajectory of AI adoption. Neuro-symbolic AI offers a way forward that combines human judgment with machine precision, and innovation with oversight. As the pressure mounts to modernize and compete, adopting transparent, controllable AI won't just be a differentiator. It will be a requirement.

Now is the time for leaders to evaluate where these capabilities can deliver the greatest impact within their organizations and to take the first steps toward building a more future-ready command center for risk and opportunity.
